

02 - Admin dashboard consumption

How the fleet Admin (admin/) reads entitlements and gates the product UI.

App: <https://admin.kabpro.pro> - local :3000 Depends on: Server GET /api/billing/me (see 01-SERVER-IMPLEMENTATION.md)

1. Current state

- All sidebar modules visible to every logged-in agency user
 - Roles admin / manager / operator are display-only
 - No plan / trial / usage UI
 - Unauthorized API -> session clear (fleetos:unauthorized) already works
-

2. Target UX

- After login, load entitlements once
 - Sidebar / routes respect can('feature.key')
 - Locked module -> upgrade page (not blank 404)
 - Trial banner: "X days left on Professional trial"
 - Profile / Billing shows plan, benefits, usage bars
 - Create vehicle when over quota -> toast from API error QUOTA_*
-

3. EntitlementProvider

New: admin/src/context/EntitlementContext.tsx

```
type EntitlementsState = {
  loading: boolean;
  status: 'Trial' | 'Active' | 'PastDue' | 'Expired' | 'Cancelled' | null;
  daysLeft: number | null;
  plan: { name: string; code: string; country: string; currency: string } | null;
  benefits: { title: string; detail?: string }[];
  features: Record<string, boolean | number>;
  limits: Record<string, number>;
  usage: Record<string, number>;
  can: (key: string) => boolean;
  refresh: () => Promise<void>;
};
```

Bootstrap

Wrap inside existing providers (after AuthProvider):

```
<AuthProvider>
  <EntitlementProvider>
    <AgencyProvider>
      ...
```

- Fetch GET \${API_URL}/billing/me when token present
- On 401 -> existing unauthorized path
- Soft-fail: if endpoint missing (older API), can() returns true (dev safety) until enforce flag

Helpers

```
can('departments.monthly_billing')
usagePct('vehicles') // usage/limits
isTrialing
isExpired
```

4. Map modules -> feature keys

Use keys from docs/01-ADMIN-FEATURES.md.

Sidebar / route	Required feature (example)
Dashboard	module.dashboard
Vehicles	vehicles.crud
Drivers list	drivers.crud
Attendance	drivers.attendance
Driver expenses	drivers.expenses
Payroll	drivers.payroll
Dept contracts	departments.contracts
Duty logs	departments.duty_logs
Monthly billing	departments.monthly_billing
Weekend billing	departments.weekend_billing
Dept payments	departments.payments
Booking	bookings.crud
FASTag / Fuel / All expenses	expenses.*
Profitability	profitability.overview
Revenue	revenue.overview
Compliance	compliance.vehicle
Maintenance	maintenance.crud
Activity	activity.feed
Reports (support)	support.tickets
Notifications	notifications.in_app

Sidebar: hide or show lock icon when `!can(key)`. Router: wrap protected views with `<RequireFeature feature="..." />`.

5. Components to add

5.1 Trial / plan banner

admin/src/components/billing/PlanStatusBanner.tsx

- Show when status === 'Trial' or PastDue or Expired
- CTA: "View plan" -> /billing or /profile?tab=plan

5.2 Billing / Plan page

admin/src/components/modules/billing/BillingView.tsx Route: /billing or Profile tab

Show:

- Plan name, country price, billing cycle
- Benefits list (from API)
- Feature checklist (human labels for keys)

- Usage bars: vehicles / drivers / users
- Button: "Request upgrade" -> POST /api/billing/upgrade-request

5.3 Locked module panel

When user hits locked route:

This feature is on Professional and above.
Your plan: Starter - Upgrade to unlock Department billing.

5.4 Quota-aware create buttons

Before opening Add Vehicle modal, if `usage.vehicles >= limits.vehicles`, open upgrade modal instead of form. Still rely on server for final deny.

6. API client changes

Use existing api / apiRequest so 401 refresh still works.

Handle structured errors:

```
if (err.code === 'FEATURE_LOCKED' || err.code?.startsWith('QUOTA_')) {  
  showUpgradeToast(err);  
}
```

Do not special-case logout on 403 FEATURE_LOCKED - that is not session death.

7. Role x entitlement (P4)

Later:

- Entitlements unlock modules
- Role unlocks actions inside modules (e.g. operator cannot settle payroll even if payroll feature on)

Until P4, any seat with a feature can use it fully.

8. Implementation steps (Admin)

- Add EntitlementContext + wire in App.tsx
 - Add /billing route + banner in MainLayout
 - Annotate Sidebar.tsx items with featureKey
 - Add RequireFeature for high-value routes (departments billing, payroll, profitability)
 - Map create flows for vehicles/drivers to quota checks
 - QA with Superadmin flipping keys on a test org's plan
-

9. Local testing

- API running with entitlements seeded
 - Superadmin assigns Trial Professional to test org
 - Login Admin -> banner shows days left; Departments visible
 - Superadmin removes departments.monthly_billing (or assign Starter)
 - Refresh Admin -> billing nav locked; API returns 403
-
