

03 - Landing page consumption

How the marketing site (landing/) consumes the plan catalog for pricing and leads.

App: <https://kabpro.pro> - local typically :3001 Today: landing/app/components/Pricing.tsx uses a hardcoded plans array (Starter / Professional / Enterprise).

1. Goals

- Pricing section shows live Superadmin catalog for a country
 - Country (or currency) selector for multi-market pricing
 - CTA opens inquiry / trial with interested plan code
 - Inquiry creates a PlatformLead (or existing inquiry API) visible in Superadmin
 - Landing never enforces entitlements - marketing only
-

2. Current Pricing.tsx (baseline)

Hardcoded cards:

- Starter - Free forever
- Professional - ?2,999 / month (featured)
- Enterprise - Custom

This will drift from Superadmin seeds unless replaced by API.

3. Public API contract

Server must expose (see 01-SERVER-IMPLEMENTATION.md):

```
GET /api/public/plans?country=IN
```

Env on Landing (Next.js):

```
NEXT_PUBLIC_API_URL=https://api.kabpro.pro/api  
# or http://localhost:5000/api in development
```

CORS: API allows <https://kabpro.pro>, <https://www.kabpro.pro>, and localhost landing origin.

4. Implementation plan (Landing)

4.1 Fetch helper

landing/app/lib/plans.ts

```

export type PublicPlan = {
  code: string;
  name: string;
  description: string;
  priceMonthly: number;
  priceYearly: number;
  pricingLabel?: string;
  currency: string;
  trialDays: number;
  featured: boolean;
  benefits: { title: string; detail?: string }[];
  limits?: { vehicles?: number; drivers?: number; users?: number };
};

export async function fetchPublicPlans(country: string): Promise<PublicPlan[]> {
  const base = process.env.NEXT_PUBLIC_API_URL;
  const res = await fetch(`${base}/public/plans?country=${country}`, {
    next: { revalidate: 300 }, // ISR-friendly if called from server
  });
  if (!res.ok) throw new Error('Failed to load plans');
  const data = await res.json();
  return data.plans || [];
}

```

Prefer server component fetch or route handler to avoid exposing unnecessary client logic; keep Pricing as client only if country toggle needs interactivity.

4.2 Replace hardcoded cards

In Pricing.tsx:

- State: country default IN (detect from locale / query ?country= later)
- Load plans on mount / country change
- Map benefits -> feature list (fallback to empty + "Contact sales")
- Format price with currency symbol map (INR -> ₹, AED -> AED, USD -> \$)
- pricingLabel overrides numeric display (Free, Custom)
- Skeleton / error -> keep last good cache or static fallback for resilience

4.3 Country switcher

Simple chips: IN - AE - US (extend from API later via GET /api/public/markets if added).

Changing country refetches plans - prices and benefit text can differ per market.

4.4 CTA wiring

Plan type	CTA	Action
Free / Starter with 0 price	Start Free	Link to https://admin.kabpro.pro/register or #inquiry with plan code
Paid with trialDays	Start Free Trial	Inquiry prefilled interestedPlan=CODE or Admin register
Custom / Enterprise	Contact Sales	Scroll to InquiryForm with plan code

Pass plan code via:

- Query: `/#inquiry?plan=PROFESSIONAL`
- Or React state lift between Pricing and InquiryForm

4.5 Inquiry -> Superadmin lead

Option A (preferred): POST /api/public/leads (new public, rate-limited) -> creates PlatformLead with source: 'Landing', interestedPlan.

Option B: Existing inquiry email / form endpoint; Superadmin imports later (weaker).

InquiryForm fields should include hidden/select Interested plan.

5. Content rules (keep Landing honest)

Show on Landing	Do not show
Name, description, benefits	Internal entitlement keys
Monthly / yearly price	Soft-limit internals unless marketed ("Up to 50 vehicles")
Trial length	Org-specific overrides
Featured flag	Inactive plans

Limits may appear as benefit text ("Up to 100 vehicles") derived from limits.vehicles if product wants auto-copy.

6. FAQ / Navbar consistency

- Navbar already links #pricing - keep
 - FAQ subscription payment wording should match real checkout status (today: "contact / trial"; update when P5 payments land)
 - Footer Pricing link unchanged
-

7. Fallback strategy

If API down:

- Show cached ISR page if using Next revalidate
 - Else fall back to minimal static 3-tier copy marked "indicative"
 - Never block the whole landing on pricing failure - degrade Pricing section only
-

8. Implementation checklist (Landing)

- [] Add NEXT_PUBLIC_API_URL to landing env examples
 - [] Implement fetchPublicPlans
 - [] Refactor Pricing.tsx to API-driven cards + country toggle
 - [] Wire CTA -> InquiryForm with interestedPlan
 - [] Add public lead API (server) + connect form
 - [] Verify CORS from kabpro.pro -> api.kabpro.pro
 - [] QA: change Superadmin IN Professional price -> Landing updates within cache TTL
-

9. Out of scope for Landing

- Login / JWT
- Entitlement enforcement
- Usage meters
- Seat management

Those belong to Admin + Server only.
